# More Conditionals and Loops

- Additional Java conditional and repetition statements
- Chapter 6 focuses on:
  - the switch statement
  - the conditional operator 
  - the do loop 
  - the for loop
  - 😊 drawing with the aid of conditionals and loops
  - 😊 dialog boxes

# Outline

**The `switch` Statement**

**The Conditional Operator** 

**The `do` Statement** 

**The `for` Statement**

 **Drawing with Loops and Conditionals**

 **Dialog Boxes**

# The switch Statement

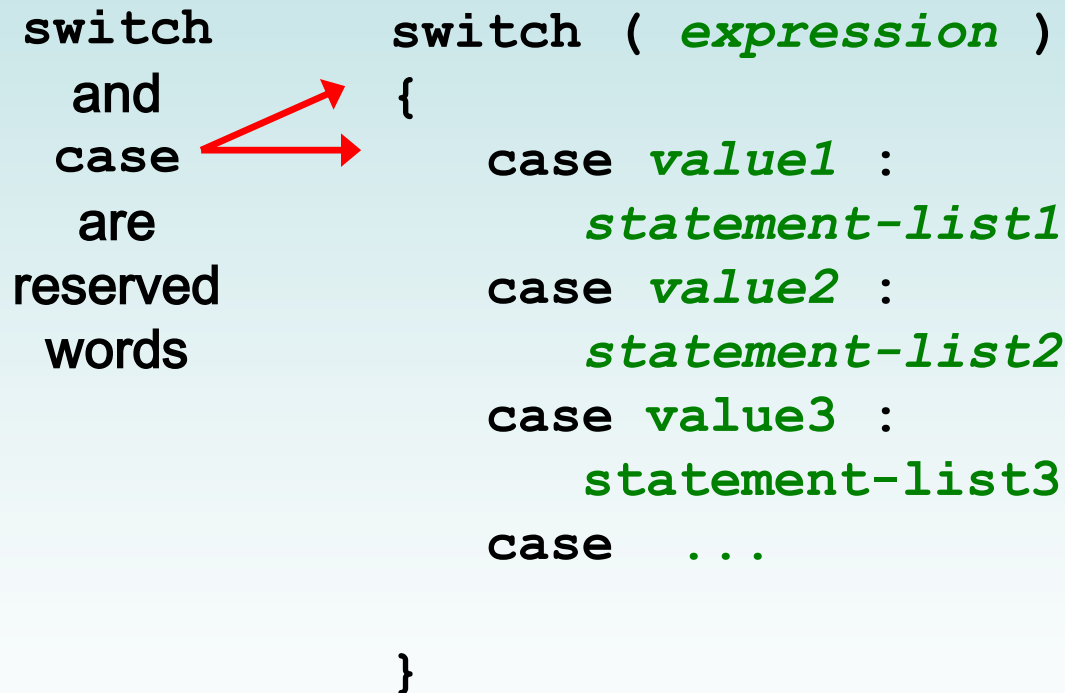

- The *switch statement* provides a way to pick one of several choices
  - Same can be done with nested ifs
  - The switch statement is not needed in a language
- The `switch` statement evaluates an expression, then attempts to match the result to one of several *cases*
- Each case contains a value and a list of statements
- Control transfers to the statement associated with the first case value that matches

# The switch Statement

- The general syntax of a `switch` statement is:

`switch`  
and  
`case`  
are  
reserved  
words

```
switch ( expression )  
{  
    case value1 :  
        statement-list1  
    case value2 :  
        statement-list2  
    case value3 :  
        statement-list3  
    case ...  
}
```

If *expression*  
matches *value2*,  
control jumps  
to here

# The switch Statement

- A *break statement* is often the last statement in a statement list
- A `break` statement causes control to transfer to the end of the `switch` statement
- If a `break` statement is not used, the flow of control will continue into the next case
  - Sometimes this is what you want, but usually not

# Example switch Statement

```
switch (option)
{
    case 'A':
        aCount++;
        break;
    case 'B':
        bCount++;
        break;
    case 'C':
        cCount++;
        break;
}
```

# The switch Statement

- A `switch` statement can have an optional *default case*
- The default case has no associated value and simply uses the reserved word `default`
- If the default case is present, control will transfer to it if no other case value matches
- If there is no default case, and no other value matches, control falls through to the statement after the switch

# The switch Statement

- The type of a switch expression must be integers, characters, or enumerated types
- As of Java 7, a switch can also be used with strings
- You cannot use a switch with floating point values
- The implicit boolean condition in a `switch` statement is equality
- You cannot perform relational checks with a `switch` statement
- **See** `GradeReport.java`

```

//*****
//  GradeReport.java          Author: Lewis/Loftus
//
//  Demonstrates the use of a switch statement.
//*****

import java.util.Scanner;

public class GradeReport
{
    //-----
    //  Reads a grade from the user and prints comments accordingly.
    //-----
    public static void main(String[] args)
    {
        int grade, category;

        Scanner scan = new Scanner(System.in);

        System.out.print("Enter a numeric grade (0 to 100): ");
        grade = scan.nextInt();

        category = grade / 10;

        System.out.print("That grade is ");

```

**continue**

## continue

```
switch (category)
{
    case 10:
        System.out.println("a perfect score. Well done.");
        break;
    case 9:
        System.out.println("well above average. Excellent.");
        break;
    case 8:
        System.out.println("above average. Nice job.");
        break;
    case 7:
        System.out.println("average.");
        break;
    case 6:
        System.out.println("below average. You should see the");
        System.out.println("instructor to clarify the material "
                           + "presented in class.");
        break;
    default:
        System.out.println("not passing.");
}
}
```

continue

## Sample Run

```
swi {
    Enter a numeric grade (0 to 100): 91
    That grade is well above average. Excellent.
    System.out.println ("a perfect score. Well done.");
    break;
case 9:
    System.out.println ("well above average. Excellent.");
    break;
case 8:
    System.out.println ("above average. Nice job.");
    break;
case 7:
    System.out.println ("average.");
    break;
case 6:
    System.out.println ("below average. You should see the");
    System.out.println ("instructor to clarify the material "
        + "presented in class.");
    break;
default:
    System.out.println ("not passing.");
}
}
```

# Outline

The `switch` Statement

The Conditional Operator

The `do` Statement

The `for` Statement

😊 Drawing with Loops and Conditionals

😊 Dialog Boxes

# The Conditional Operator

- The *conditional operator* evaluates to one of two expressions based on a boolean condition
- Its syntax is:

*condition* ? *expression1* : *expression2*

- If the *condition* is true, *expression1* is evaluated; if it is false, *expression2* is evaluated
- The value of the entire conditional operator is the value of the selected expression

# The Conditional Operator

- The conditional operator is similar to an `if-else` statement, except that it is an expression that returns a value

- For example:

```
larger = (num1 > num2) ? num1 : num2 ;
```

- If `num1` is greater than `num2`, then `num1` is assigned to `larger`; otherwise, `num2` is assigned to `larger`
- The conditional operator is *ternary* because it requires three operands

# The Conditional Operator

- Another example:

```
System.out.println("Your change is " + count +  
    ((count == 1) ? "Dime" : "Dimes"));
```

- If `count` equals 1, the "Dime" is printed
- If `count` is anything other than 1, then "Dimes" is printed

# Quick Check

Express the following logic in a misleading and difficult to understand manner using the conditional operator.

```
if (val <= 10)
    System.out.println("It is not greater than 10.");
else
    System.out.println("It is greater than 10.");
```

# Quick Check

Express the following logic in a misleading and difficult to understand manner using the conditional operator.

```
if (val <= 10)
    System.out.println("It is not greater than 10.");
else
    System.out.println("It is greater than 10.");

System.out.println("It is" +
    ((val <= 10) ? " not" : "") +
    " greater than 10.");
```

# Outline

**The `switch` Statement**

**The Conditional Operator**

**The `do` Statement**

**The `for` Statement**

😊 **Drawing with Loops and Conditionals**

😊 **Dialog Boxes**

# The do Statement

- A *do statement* has the following syntax:

```
do
{
    statement-list;
}
while (condition);
```

- The *statement-list* is executed once initially, and then the *condition* is evaluated

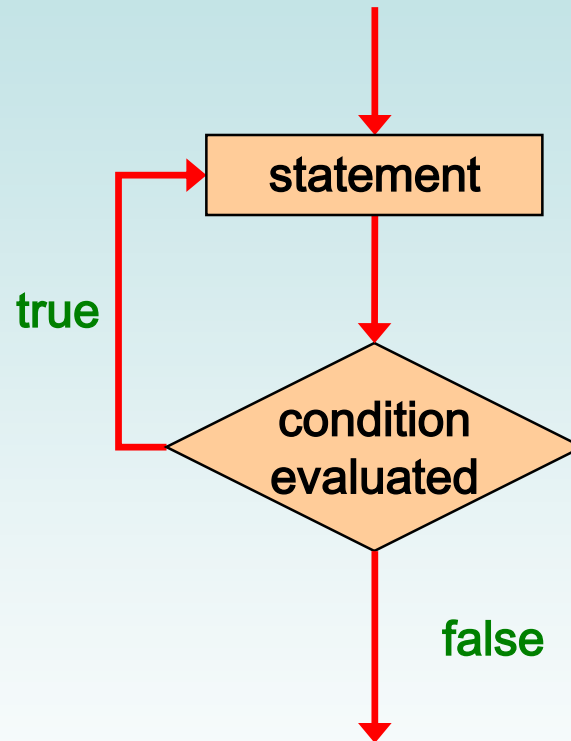

# The do Statement

- The statement is executed repeatedly until the condition becomes false
- The do statement adds no power to Java
  - anything written with a do can be written with a while (or for)
- Almost always a bug

# Logic of a do Loop

# The do Statement

- An example of a `do` loop:

```
int count = 0;
do
{
    count++;
    System.out.println(count);
} while (count < 5);
```

- The body of a `do` loop executes at least once
- See `ReverseNumber.java`

```

//*****
//  ReverseNumber.java          Author: Lewis/Loftus
//
//  Demonstrates the use of a do loop.
//*****

import java.util.Scanner;

public class ReverseNumber
{
    //-----
    //  Reverses the digits of an integer mathematically.
    //-----
    public static void main(String[] args)
    {
        int number, lastDigit, reverse = 0;

        Scanner scan = new Scanner(System.in);

```

**continue**

## continue

```
System.out.print("Enter a positive integer: ");
number = scan.nextInt();

do
{
    lastDigit = number % 10;
    reverse = (reverse * 10) + lastDigit;
    number = number / 10;
}
while (number > 0);

System.out.println("That number reversed is " + reverse);
}
```

continue

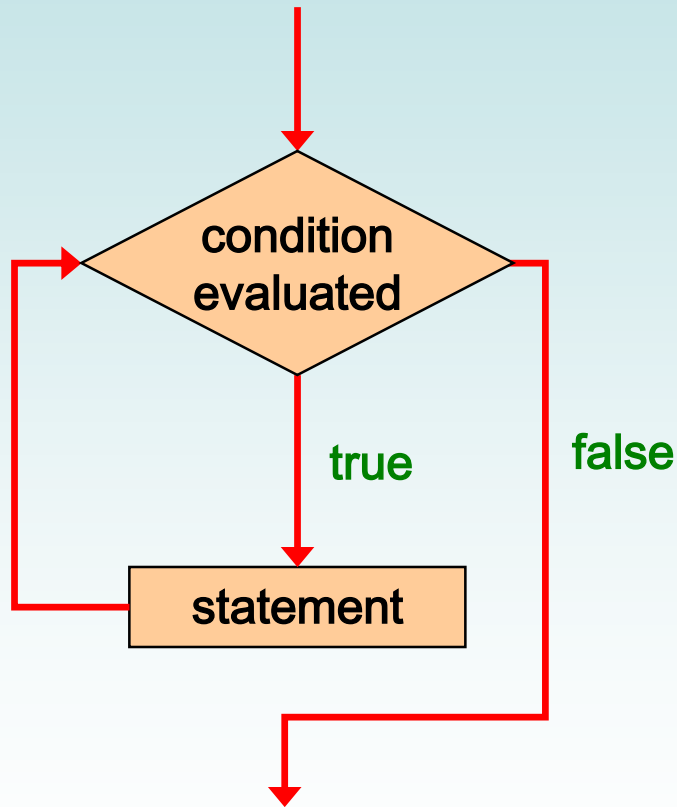

## Sample Run

```
System.out. Enter a positive integer: 2896  
number = sc That number reversed is 6982
```

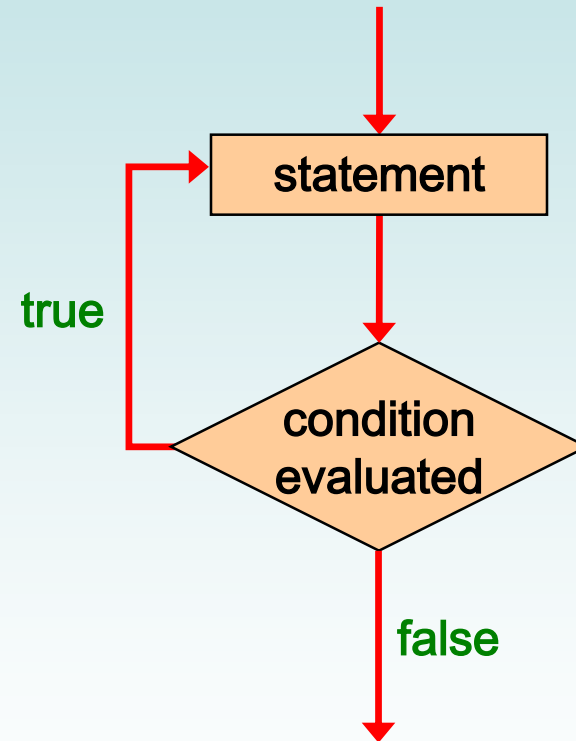

```
do  
{  
    lastDigit = number % 10;  
    reverse = (reverse * 10) + lastDigit;  
    number = number / 10;  
}  
while (number > 0);  
  
System.out.println("That number reversed is " + reverse);  
}  
}
```

# Comparing while and do

## The while Loop

## The do Loop

# Outline

**The `switch` Statement**

 **The Conditional Operator**

 **The `do` Statement**

 **The `for` Statement**

 **Drawing with Loops and Conditionals**

 **Dialog Boxes**

# The for Statement

- A *for statement* has the following syntax:

The *initialization*  
is executed once  
before the loop begins

The *statement* is  
executed until the  
*condition* becomes false

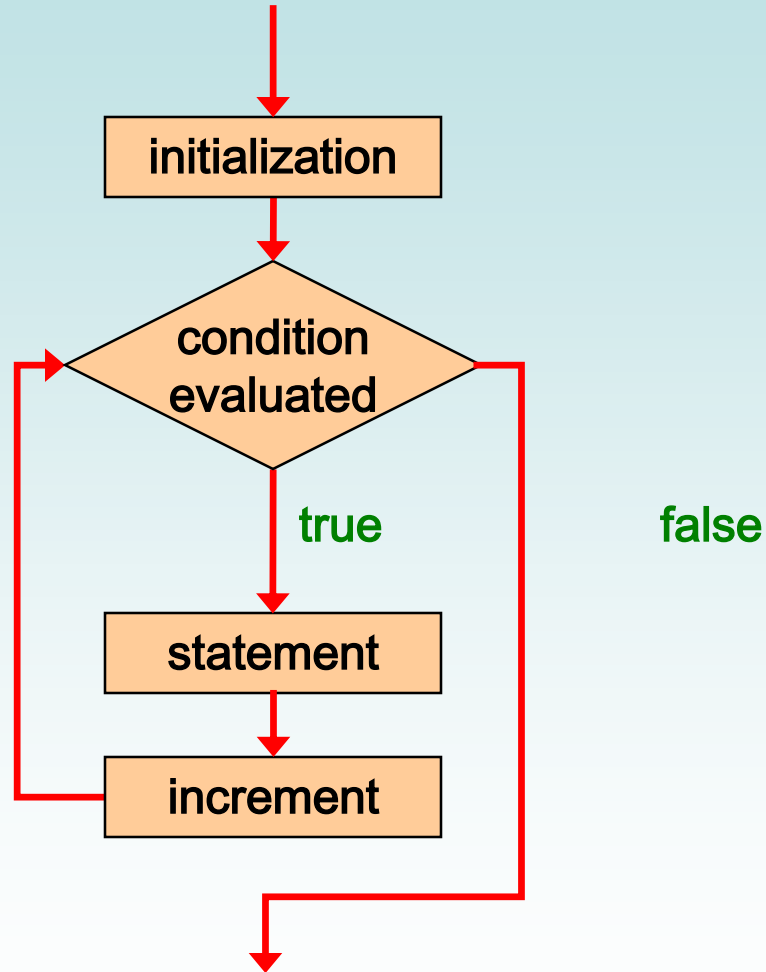

```
for ( initialization ; condition ; increment )  
    statement;
```

The *increment* portion is executed at  
the end of each iteration

# Logic of a for loop

# The for Statement

- A `for` loop is functionally equivalent to the following `while` loop structure:

```
initialization;  
while ( condition )  
{  
    statement;  
    increment;  
}
```

- It puts the **three things** that must be coordinated for a loop all in one statement
- It can be used to build any of the **three types** of loops

# The for Statement

- An example of a `for` loop:

```
for (int count=1; count <= 5; count++)  
    System.out.println(count);
```

- The initialization section can be used to declare a variable
- Like a `while` loop, the condition of a `for` loop is tested prior to executing the loop body
- Therefore, the body of a `for` loop will execute zero or more times

# The for Statement

- The increment section can perform any calculation:

```
for (int num=100; num > 0; num -= 5)  
    System.out.println(num) ;
```

- A `for` loop is well suited for executing statements a specific number of times that can be calculated or determined in advance
- See `Multiples.java`
- See `Stars.java`

```

//*****
//  Multiples.java      Author: Lewis/Loftus
//
//  Demonstrates the use of a for loop.
//*****

import java.util.Scanner;

public class Multiples
{
    //-----
    //  Prints multiples of a user-specified number up to a user-
    //  specified limit.
    //-----
    public static void main(String[] args)
    {
        final int PER_LINE = 5;
        int value, limit, mult, count = 0;

        Scanner scan = new Scanner(System.in);

        System.out.print("Enter a positive value: ");
        value = scan.nextInt();

```

**continue**

## continue

```
System.out.print("Enter an upper limit: ");
limit = scan.nextInt();

System.out.println();
System.out.println("The multiples of " + value + " between " +
    value + " and " + limit + " (inclusive) are:");

for (mult = value; mult <= limit; mult += value)
{
    System.out.print(mult + "\t");

    // Print a specific number of values per line of output
    count++;
    if (count % PER_LINE == 0)
        System.out.println();
}
}
```

## Sample Run

Enter a positive value: 7

Enter an upper limit: 400

The multiples of 7 between 7 and 400 (inclusive) are:

7	14	21	28	35
42	49	56	63	70
77	84	91	98	105
112	119	126	133	140
147	154	161	168	175
182	189	196	203	210
217	224	231	238	245
252	259	266	273	280
287	294	301	308	315
322	329	336	343	350
357	364	371	378	385
392	399			

+  
'');

```

//*****
// Stars.java      Author: Lewis/Loftus
//
// Demonstrates the use of nested for loops.
//*****

public class Stars
{
    //-----
    // Prints a triangle shape using asterisk (star) characters.
    //-----
    public static void main(String[] args)
    {
        final int MAX_ROWS = 10;

        for (int row = 1; row <= MAX_ROWS; row++)
        {
            for (int star = 1; star <= row; star++)
                System.out.print("*");

            System.out.println();
        }
    }
}

```

```
//*****
// Stars.java      Auth
//
// Demonstrates the use
//*****
```

```
public class Stars
{
    //-----
    // Prints a triangle
    //-----
    public static void mai
    {
        final int MAX_ROWS

        for (int row = 1; row <= MAX_ROWS; row++)
        {
            for (int star = 1; star <= row; star++)
                System.out.print("*");

            System.out.println();
        }
    }
}
```

## Output

```
*
**
***
****
*****
*****
*****
*****
*****
*****

*****
```

```
*****
s
oops.
*****
-----
erisk (star) characters.
-----
s)
```

# Quick Check

Write a code fragment that rolls a die 100 times and counts the number of times a 3 comes up.

# Quick Check

Write a code fragment that rolls a die 100 times and counts the number of times a 3 comes up.

```
Die die = new Die();  
int count = 0;  
for (int num=1; num <= 100; num++)  
    if (die.roll() == 3)  
        count++;  
System.out.println(count);
```

# The for Statement

- Each expression in the header of a `for` loop is optional
- If the initialization is left out, no initialization is performed
- If the condition is left out, it is always considered to be true, and therefore creates an infinite loop
- If the increment is left out, no increment operation is performed

# For-each Loops

- A variant of the `for` loop simplifies the repetitive processing of items in an iterator
- For example, suppose `bookList` is an `ArrayList<Book>` object
- The following loop will print each book:

```
for (Book myBook : bookList)
    System.out.println(myBook) ;
```

- This version of a `for` loop is often called a *for-each loop*

# For-each Loops

- A for-each loop can be used on any object that implements the `Iterable` interface
- It eliminates the need to retrieve an iterator and call the `hasNext` and `next` methods explicitly
- It also will be helpful when processing arrays, which are discussed in Chapter 8

# Quick Check

Write a for-each loop that prints all of the `Student` objects in an `ArrayList<Student>` object called `roster`.

# Quick Check

Write a for-each loop that prints all of the `Student` objects in an `ArrayList<Student>` object called `roster`.

```
for (Student student : roster)
    System.out.println(student) ;
```

# Outline

**The `switch` Statement**

**The Conditional Operator**

**The `do` Statement**

**The `for` Statement**

😊 **Drawing with Loops and Conditionals**

😊 **Dialog Boxes**

# Dialog Boxes

- A *dialog box* is a window that appears on top of any currently active window
- It may be used to:
  - convey information
  - confirm an action
  - allow the user to enter data
  - pick a color
  - choose a file
- A dialog box usually has a specific, solitary purpose, and the user interaction with it is brief

# ☺ Dialog Boxes

- The `JOptionPane` class provides methods that simplify the creation of some types of dialog boxes
- See `EvenOdd.java`
- Specialized dialog boxes for choosing colors and files are covered in Chapter 9

```

/*****
//  EvenOdd.java          Author: Lewis/Loftus
//
//  Demonstrates the use of the JOptionPane class.
//*****/

import javax.swing.JOptionPane;

public class EvenOdd
{
    //-----
    //  Determines if the value input by the user is even or odd.
    //  Uses multiple dialog boxes for user interaction.
    //-----
    public static void main(String[] args)
    {
        String numStr, result;
        int num, again;

```

**continue**

## continue

```
do
{
    numStr = JOptionPane.showInputDialog("Enter an integer: ");
    num = Integer.parseInt(numStr);

    result = "That number is " + ((num%2 == 0) ? "even" : "odd");

    JOptionPane.showMessageDialog(null, result);
    again = JOptionPane.showConfirmDialog(null, "Do Another?");
}
while (again == JOptionPane.YES_OPTION);
}
```

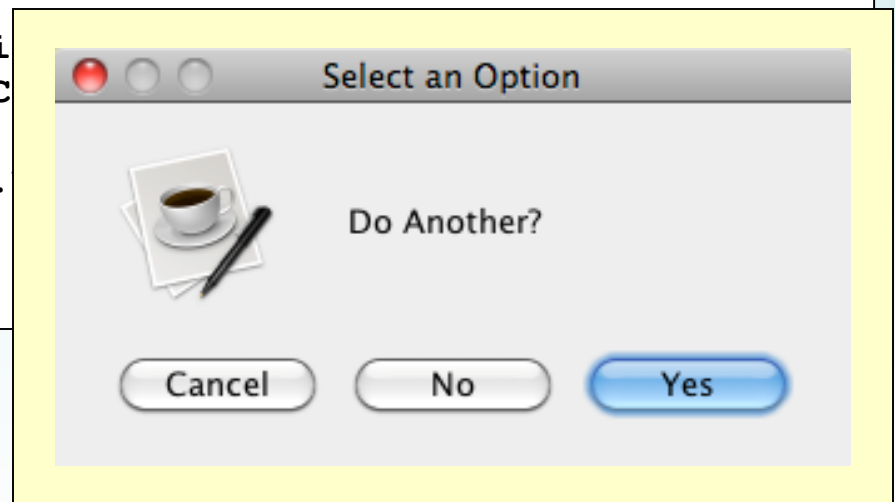

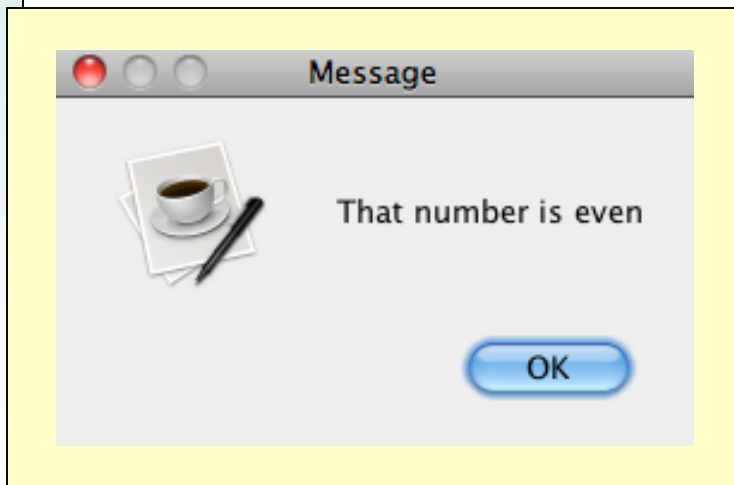

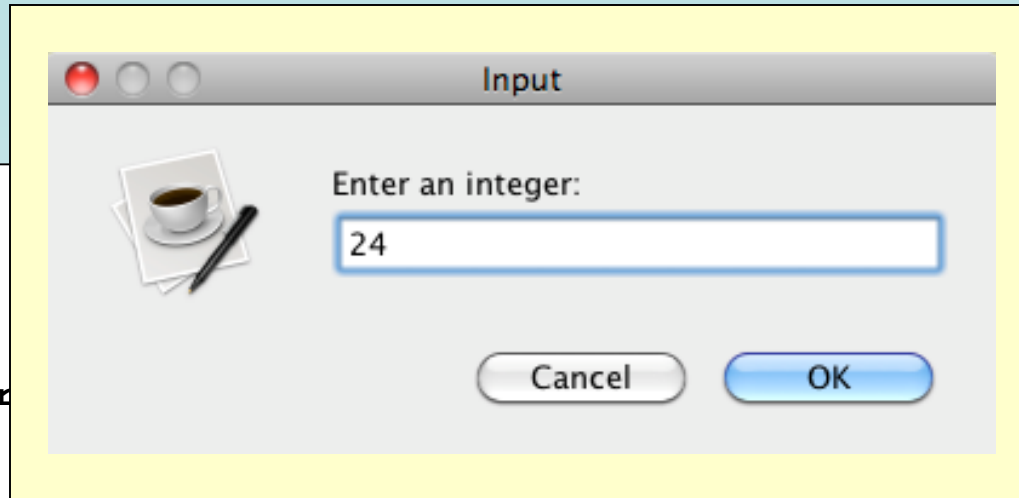

**continue**

```
do  
{
```

```
    numStr  
    num =
```

```
    result = "That number is " + ((num%2 == 0) ? "even" : "odd");
```

```
    eger: ");
```

# Summary

- Chapter 6 focused on:
  - the switch statement
  - the conditional operator
  - the do loop
  - the for loop
  - 😊 drawing with the aid of conditionals and loops
  - 😊 dialog boxes
